## HOMEWORK \# $\mathbf{1}^{1}$

1. Find the general solution of the following differential equation.

$$
\begin{equation*}
x \frac{d y}{d x}-4 y=x^{6} e^{x} \tag{1}
\end{equation*}
$$

2. Solve the following exact differential equation.

$$
\begin{equation*}
\left(e^{2 y}-y \cos x y\right) d x+\left(2 x e^{2 y}-x \cos x y+2 y\right) d y=0 \tag{2}
\end{equation*}
$$

3. Use the method of homogenous equations to solve the following differential equation.

$$
\begin{equation*}
\left(x^{2}+y^{2}\right) d x+\left(x^{2}-x y\right) d y=0 \tag{3}
\end{equation*}
$$

4. Use integration factor to solve the following differential equation.

$$
\begin{equation*}
x y d x+\left(2 x^{2}+3 y^{2}-20\right) d y=0 \tag{4}
\end{equation*}
$$

5. Find the solution of the following differential equation using the reduction of order.

$$
\begin{equation*}
\left[y^{\prime}\right]^{2}=x^{2} y^{\prime \prime} \tag{5}
\end{equation*}
$$
