Activity Modeling and Business Process ReEngineering

Company strategy (and objectives) is managed by activities. Success of strategies is directly related to the efficiency and effectiveness of activities.

Activities are like road maps to reach the destination (objectives).

cetinerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Activity Modeling and Business Process Re-engineering

Company strategy covers 4 broad areas:

1. Market place chosen to be served
2. Identifying Services and products for this market
3. Marketing and Sales channels to access this market
4. *Activities and Processes to apply Strategies*

cetinerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Activity (or Process Models)

Activities are hearts of organizations.

Activity Model: Defines the organization as a system of interrelated activities

cetinerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Activity (or Process Models)

Activities are hearts of organizations.

- * Activities are difficult to express as texts.
- * Activities should be clear and easy to understand
- * Easy to change between high-level and low-level detail
- * Graphics (visual representation) facilitate communication

cetinerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Activity (or Process Models)

- * Activities are difficult to express as texts.

Activity (or Process Models)

* Activities are difficult to express as texts.

Which one is easier to understand?

cetiner@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Activity Model vs Process Model

- In activity models, the job (business function) is more important than the actor who performs the job.
- In process models (or process flow models), the actor who performs the activity is also important (e.g. Process models in Oracle Designer).
- BPwin supports both methods

cetiner@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Why Modeling?

In all types of organizations, the quality and success result from the *processes*, or *activities*.

cetiner@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Why Modeling?

Modeling is essential to understand the interactions between the activities and communicate to make them more effective and efficient.

Using CASE tools, you can have automatic support for Information System Development.

cetiner@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Why Modeling?

Helps the software developer in Form Design

cetiner@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Why Modeling?

Integration with Data Modeling

cetiner@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

What is Process Modeling?

- * An effective method to understand business rules and processes
- * You can hide the details and focus on required parts
- * Visual Objects (using graphics) facilitate communication
- * A standard for Quality Management

cetinerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

History

* SADT (Structured Analysis and Design Technique) was developed by SofTech in 1960. It is the basis for IDEF0 notations.

* US Airforce accepted it as a standard in 1970s and DoD (Department of Defence) adopted as a standard

* In 1993, IDEF Users Group (Society of Enterprise Engineering) worked together with NIST and produced FIPS (Federal Information Processing Standards)

* IDEF3 was developed by Air Forces and DFD was developed independently.

Process Modeling using BPWin

Using BPWin;
You can understand analyze, and document complicated processes

cetinerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Process Modeling using BPWin

Using BPwin;
You can relate process models with ERwin data models.

cetinerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Process Modeling using BPWin

Using BPWin;
Activity models can be transferred to simulation modeling tools.

cetinerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Process Modeling using BPWin

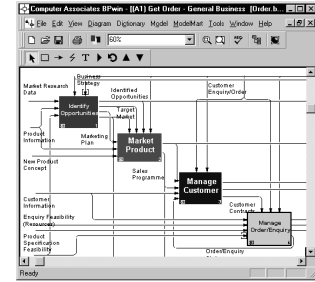

Benefits

- * Removing the activities which are repetitive and insufficient
- * Reducing costs
- * Increasing flexibility
- * Increasing Customer relations

cetinerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Process Modeling using BPWin

cetinerg@itu.edu.tr

- * Business activity diagrams
- * Inputs, Controls, Outputs and Mechanisms
- * Picture of all processes within the organization
- * Necessary for Form Design

Assoc.Prof.Dr.B.G. Çetiner ©2002

BPwin: Types of Process Modeling

cetinerg@itu.edu.tr

BPwin supports 3 modeling methods.

- * Business Process Modeling (IDEF0)
- * Process Flow Modeling (IDEF3)
- * Data Flow Modeling (DFD)

Assoc.Prof.Dr.B.G. Çetiner ©2002

Business Process Modeling (IDEF0)

Example: A simple Business Process Diagram

cetinerg@itu.edu.tr

- * IDEF0 (Integration Definition Language) is activity modeling technique
- * All system is described as set of interrelated activities and functions.
- * System activities (actions) are examined independent of the objects which perform these activities

Assoc.Prof.Dr.B.G. Çetiner ©2002

Data Flow Diagram (DFD)

Example: Data Flow Diagram

cetinerg@itu.edu.tr

* Data Flow Diagrams are used to model data flow between data stores and activities

Assoc.Prof.Dr.B.G. Çetiner ©2002

Data Flow Diagram (DFD)

Example: Data Flow Diagram

cetinerg@itu.edu.tr

Arrows in data flow diagrams show the movement of data between activities.

- 4 simple elements
- * Arrows
 - * Data Store
 - * Activity (Process)
 - * External Reference (or entity) (Source/sink)

Assoc.Prof.Dr.B.G. Çetiner ©2002

Process Flow Modeling (IDEF3)

Example: Data Flow Diagram

cetinerg@itu.edu.tr

It is also called Process Flow Modeling.

Main Objective: To model activities (processes) in forms of sequential events.

Assoc.Prof.Dr.B.G. Çetiner ©2002

Process Flow Modeling (IDEF3)

Process Flow Models can be used in simulation modeling applications.

IDEF3 diagrams are similar to Business Process Models in Oracle Designer.

Example: Data Flow Diagram

cetnerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

3 Models in SDLC

IDEF0: Suitable for Analysis and Logical Design. Can also be used for all modeling.

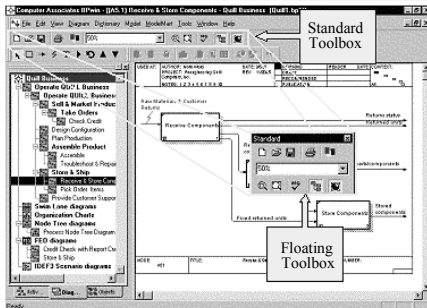

IDEF3: can be connected to IDEF0 diagrams

DFD : for Design purpose

BPwin Context (Root) Diagram

Business Process Models

System is comprised of interrelated activities.

The top activity is called root (context) activity. Root activity defines the system. The lower diagrams in hierarchy called decomposition diagrams.

BPwin Context (Root) Diagram

A root activity for IDEFO

ROOT ACTIVITY DIAGRAM
Each activity name is combination of a verb and an object name describing the activity objective.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

ICOM (Input-Control-Output-Mechanism)

Use of Arrows
In IDEFO diagrams, different arrow types are connected to activities. Arrows represent people, places, concepts or events. Arrows are labeled with different names and connected between activities and borders.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

Input Arrows
Inputs represent material or information which are consumed or transformed to produce outputs.
Inputs are connected from the left hand side of activities.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

Control Arrows
Controls impose rules that regulate *how*, *when*, and if an activity is performed and *which* outputs are produced.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

Control Arrows
Controls are often in the form of rules, regulations, policies, procedures, or standards.

Control arrows are like input arrows. If you are not sure whether the arrow is input or control, then model it as control.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

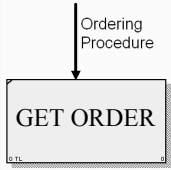

Use of Arrows

Control Arrows
While they affect the activity, they are never consumed or transformed.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

Control Arrows

Controls can also be used to describe items that trigger an activity to start or finish. For example, the receipt of a Customer Order will trigger the Order Confirmation process.

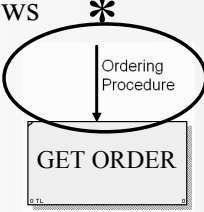

cetinerg@itu.edu.trAssoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

Control Arrows

Control arrows always enter the top side of an IDEF0 activity box.

Each activity should have at least one control arrow.

cetinerg@itu.edu.trAssoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

Output Arrows

Outputs are the material or information produced by the activity.

An activity that does *not* produce a definable output *should not be modeled* (or, at a minimum, should be a candidate for elimination).

Output arrows always exit from the right side of an IDEF0 activity box.

Each activity should have *at least one* output arrow.

The example above illustrates two different outputs produced by the *Get Order* activity.

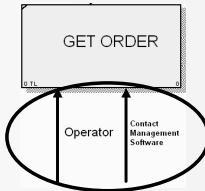

cetinerg@itu.edu.trAssoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

Mechanism Arrows

Mechanisms are physical resources that perform the activity. Mechanisms could be the important people, machinery, and/or equipment that provide and channel the energy needed to perform the activity.

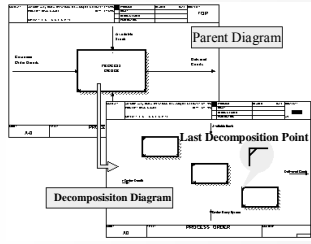

Mechanism arrows always enter the bottom side of an IDEF0 activity box. Unlike control arrows and output arrows, mechanism arrows are optional.

cetinerg@itu.edu.trAssoc.Prof.Dr.B.G. Çetiner ©2002

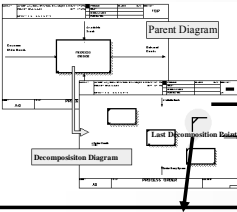

Decomposition Diagrams

Decompositions are used in business process modeling to break an activity into its constituent activities.

cetinerg@itu.edu.trAssoc.Prof.Dr.B.G. Çetiner ©2002

Decomposition Diagrams

Decompositions are used in business process modeling to break an activity into its constituent activities. Each of these activities can in turn be decomposed into its own constituent activities.

Each time you decompose an activity, you create a decomposition diagram. The number of decomposition levels is entirely up to you, and depends on the level of complexity you need to model.

Note the yellow bubble on the figure. When an activity has not been decomposed, the "leaf" symbol will appear in the upper left corner of the activity box (called a "leaf-level" activity). After decomposition the leaf symbol is removed.

cetinerg@itu.edu.trAssoc.Prof.Dr.B.G. Çetiner ©2002

Decomposition Diagrams

Decomposing Activities into Components

1. First choose the activity to be decomposed and then choose *child* tool from the tool box.
2. Choose the method of decomposition diagram from the *Activity Box Count* dialog box.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Decomposition Diagrams

Decomposition Diagrams

Decomposed activity becomes main activity.

Arrows are inherited to the decomposition diagrams.

Arrows in decomposition diagrams are then connected to suitable activities.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Decomposition Diagrams

Arrows between activities

Connection to border

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

5 different usages are available.

1. Output-Input
2. Output-Control
3. Output-Mechanism
4. Output-Control Feedback
5. Output-Input Feedback

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

1. Output-Input

After Customer Credit Information is Approved, it is sent to *Approve Order* Activity to be approved.

```

graph LR
    A[Approve Credit] -- Approved Customer --> B[Approve Order]
  
```

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

2. Output-Control

In this type, the first activity has an affecting (control) role on the second activity.

It controls the second activity on how to convert inputs (accepted plans) into outputs. In the following example, the accepted plan is not changed and it controls the implementation of plan.

```

graph LR
    A[Accept Project Proposal Plan] -- Accepted Plan --> B[Implement Plan]
  
```

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

3. Output-Mechanism

This connection is very rare. It shows that output of an activity is a resource or method to perform another activity.

Following example illustrates that the fixture chosen after Choose Fixture activity is used as mechanism when machining the part.

Machine the Part

Choose Fixture Fixture

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

4. Output-Control Feedback

Output is used as feedback control. After evaluating the project performance the performance result is used as control in developing a new project plan.

Result of Project Performance Evaluation

Develop Project Plan Evaluate Project Performance

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

5. Output-Input Feedback

Feedbacks of this kind are frequently used in recycling processes. In the following example, after controlling part quality the part to be re-painted is input to be cleaned and re-painted.

Part to be re-painted

Part to be painted Clean and Paint Part Painted Part Control Part Quality

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Use of Arrows

5. Output-Input Feedback

Using defected products to recycle with raw materials.

Defected Bottle

Other IDEF0 Diagrams

Node Diagram

Showing the activities as Organization Chart

It gives overall picture of the whole model. The top activity is usually root diagram. But you can choose any activity as starting point.

cetnerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Splitting and Merging Diagrams

Activities to be modeled inside projects can be split into smaller parts according to project groups and then merged later.

cetnerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Splitting and Merging Diagrams

Activities to be modeled inside projects can be split into smaller parts according to project groups and then merged later.

Splitting Model

1. Choose the activity to be split. This activity will be root activity.
2. Enter *Split Model* choice
3. Give the same activity name and then split it by using *Copy entire dictionaries* choice.

cetnerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Splitting and Merging Diagrams

Splitting Model

When you split a model, BPwin opens the new model in the workspace and,

- * The "split" activity becomes the context level of the new model, complete with any connected arrows.
- * A "placeholder" activity remains in the source model ("Market Product" in the illustration).
- * BPwin draws a Call arrow from the source model activity to the bottom diagram border, and assigns the new model name to the arrow.
- * Any decomposition diagrams of the source activity move to the new model.

cetnerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Splitting and Merging Diagrams

Merging Models

Models built separately can later be merged.

cetnerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Splitting and Merging Diagrams

Merging Two Models

Use the following steps to merge two models together:

1. Open both the source and target models.
2. Right-click on the "placeholder" activity or the Call arrow in the target model where you want to insert the source model.
3. Select Merge Model on the shortcut menu.
4. Select the appropriate merge options in the Continue with merge? dialog.
5. Click OK to finish.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Splitting and Merging Diagrams

Merging Two Models

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Adding Value to Activities

BPwin provides a framework of features that you can use to add value to your model. You can specify characteristics such as cost, time, and other properties you define.

There are two methods to specify such information:

- * Activity-Based Costing (ABC)
- * User Defined Properties (UDPs)

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Adding Value to Activities

Activity-based costing (ABC) is a technique for capturing and analyzing activity costs to determine the cost of the overall process. BPwin supports a simple implementation of ABC where you can assign costs to activities in terms of currency and time.

For example, you can use ABC to determine:

- The cost of production.
- The cost to support customers.
- The cost of proposed process changes.
- Where costs are accruing in your business processes.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Adding Value to Activities

To calculate model costs using ABC, you must follow these basic steps:

1. Define the ABC units of measurement.
2. Define the ABC cost centers.
3. Apply costing estimates to all activities in the model.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Adding Value to Activities

Defining the Units of Measurement

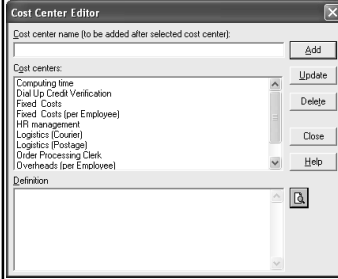

First, you must define the currency and time units to use in calculating costs. Currency units are usually measured in U.S. Dollars, though you can choose other forms of currency. Time units can be measured in seconds, minutes, hours, days, weeks months, or years.

These units are global for the model and are defined in the ABC Units tab of the Model Properties dialog. The units you select display on activities and reports.

cetinerg@itu.edu.tr Assoc.Prof.Dr.B.G. Çetiner ©2002

Adding Value to Activities

Define Cost Centers

Next you must create the ABC cost centers. Cost centers are categories of costs which are shared across all activities.

You can specify cost centers in the Cost Center Editor which can be opened from the Model menu.

cetnerg@itu.edu.tr

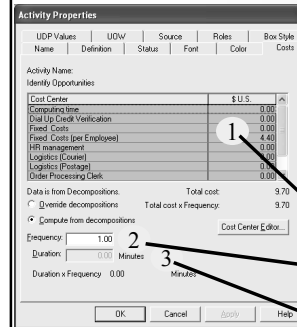

Assoc.Prof.Dr.B.G. Çetiner ©2002

Adding Value to Activities

Specify Activity Costs

After you define ABC units and cost centers, you can specify the cost of performing that activity for each cost center.

To assign activity costs, double-click the activity to open the Activity Properties dialog, and click the Costs tab.

The cost per cost center.

How often the activity occurs (Frequency). This is usually set to 1.

How long the activity takes to perform (Duration).

cetnerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

Adding Value to Activities

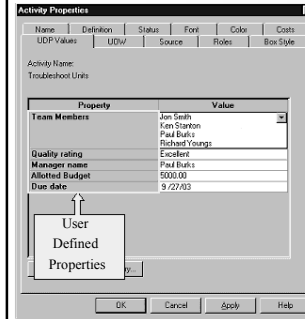

Costs for each process are calculated from the subordinate activities automatically

cetnerg@itu.edu.tr

Assoc.Prof.Dr.B.G. Çetiner ©2002

User Defined Properties (UDPs)

Objects such as Lists, Sources, Windows Commands can be defined in UDPs.

They can be defined using UDP Definition Editor and called from related activities.

cetnerg@itu.edu.tr
