Karaman

LECTURE # 12

ORDINARY DIFFERENTIAL EQUATIONS(ODE)

- FIRST ORDER ORDINARY DIFFERENTIAL EQUATIONS
- EULER'S METHOD
- RUNGE-KUTTA METHODS
- HIGHER ORDER ORDINARY DIFFERENTIAL EQUATIONS

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Celikoğlu,
Karaman

ORDINARY DIFFERENTIAL EQUATIONS

- A first-order ordinary differential equation is an equation that can be written in the following form,
- $y' = \frac{dy}{dx} = g(x, y)$
- where x is the independent variable and y is a function of x .
- Examples:
 - $y' = g_1(x, y) = 3x^2$
 - $y' = g_2(x, y) = -0.131y$
 - $y' = g_3(x, y) = 3.4444 \cdot 10^{-5} - 0.0015y$
 - $y' = g_4(x, y) = 2 \times \cos^2(y)$
 - $y' = g_5(x, y) = 3y + e^{2x}$

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Celikoğlu,
Karaman

ORDINARY DIFFERENTIAL EQUATIONS

- A solution to a first-order ODE is a function $y = f(x)$, such that $f'(x) = g(x, y)$.
- Computing the solution to a differential equation involves integration in order to obtain y from y'
- The techniques for solving differential equations are often referred to as techniques for integrating differential equations.
- The solution to a differential equation is generally a family of functions.

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

ORDINARY DIFFERENTIAL EQUATIONS

- An initial condition or boundary condition is usually needed in order to specify a unique solution.
- Using certain initial conditions, analytical solutions to the given ODE examples are listed below.
 - $y = x^3 - 7.5$
 - $y = 4 e^{-0.131 x}$
 - $y = 0.022963 - 0.020763 e^{-0.0015 x}$
 - $y = \tan^{-1}(x^2 + 1)$
 - $y = 4 e^{3x} - e^{2x}$

ODEs

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

ODEs

- Although an analytical solution to a differential equation is preferred, many differential equations have complicated analytical solutions or no analytical solution at all.
- For these cases, a numerical calculation is needed to solve the differential equation.
- The most common numerical techniques for solving ordinary differential equations are
 - Euler's Method
 - Runge-Kutta Methods.

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

ORDINARY DIFFERENTIAL EQUATIONS

- Both Euler's method and Runge-Kutta methods approximate a function using its Taylor series expansion.
- A Taylor series is an expansion that can be used to approximate a function whose derivatives exist on an interval containing a and b .
- The Taylor's series for expansion for $f(b)$ is

$$f(b) = f(a) + (b - a) f'(a) + \frac{(b - a)^2}{2!} f''(a) + \dots$$
$$+ \frac{(b - a)^n}{n!} f^{(n)}(a) + \dots$$

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

ORDINARY DIFFERENTIAL EQUATIONS

- A first-order Taylor's series approximation uses the terms involving the function and its first derivative:

$$f(b) = f(a) + (b - a) f'(a)$$

- A second-order approximation uses the terms involving the function, its first derivative, and its second derivative:

$$f(b) = f(a) + (b - a) f'(a) + \frac{(b - a)^2}{2!} f''(a)$$

- Matlab functions use approximations of order 2, 3, 4 and 5 to approximate the function value $f(b)$.

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Celikoğlu,
Karaman

FIRST ORDER APPROXIMATION(EULER'S METHOD)

- The simplest numerical method for the solution of initial value problems is Euler's method.
- It uses a fixed step size h and generates the approximate solution.
- A first order Runge-Kutta integration equation is the following:

$$y_b = y_a + h y'_a$$

- The differential equation is used to compute the value of y'_a

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Celikoğlu,
Karaman

FIRST ORDER APPROXIMATION(EULER'S METHOD)

- Once we have determined the value of y_b , we can estimate the next value of the function $f(c)$ using the following:

$$y_c = y_b + h y'_b$$

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Celikoğlu,
Karaman

FIRST ORDER APPROXIMATION(EULER'S METHOD)

- This equation uses the tangent line at y_b to estimate y_c .

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

FIRST ORDER APPROXIMATION(EULER'S METHOD)

- An initial value is needed to start the process.
- This method is also called initial-value solutions or boundary-value solutions.

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Celikoğlu,
Karaman

FIRST ORDER APPROXIMATION(EULER'S METHOD)

- The first-order Runge-Kutta Method is simple to apply.
- If the step size is large or if the slope of the function changes rapidly, it may not be very accurate.
- Higher-order Runge-Kutta integration method is used to approximate the unknown function.
- Fourth-order Runge-Kutta integration equation uses first, second, 3rd and 4th derivatives to compute the function.

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

MATLAB FUNCTIONS

- ode23, ode45
- $[x, y]=\text{ode23}(\text{'function_name'}, a, b, \text{initial}, \text{tolerance})$
- $[x, y]=\text{ode45}(\text{'function_name'}, a, b, \text{initial}, \text{tolerance})$

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

MATLAB FUNCTIONS

- x and y : the set of coordinates that represent the function $y = f(x)$
- `function_name`: defines a function that returns the values of the differential equation $y' = g(x, y)$
- a and b : endpoints of the interval.
- `initial` : the value of the left endpoint of the interval.

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

EXAMPLE 1:

- $y' = g_1(x, y) = 3x^2$
- interval $[2, 4]$
- $y = f(2) = 0.5$

Answer: $y = x^3 - 7.5$

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

EXAMPLE 1:

```
function dy=g1(x,y)
% function dy/dx=g1
%
dy=3*x.^2;
```

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

EXAMPLE 1:

```
% plot analytical and numerical solutions
% [a, b] = [2. 4]
% initial condition y=f(2)=0.5
[x, num_y]=ode23('g1', 2,4,0.5);
y=x.^3-7.5;
subplot(2,1,1),plot(x,num_y,x,y,'o'),...
title('Solution to Equation 1'),...
xlabel('x'), ylabel('y=f(x)'), grid
```

ORDINARY DIFFERENTIAL EQUATIONS

and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

EXAMPLE 1:

The screenshot shows the MATLAB 7.6.0 (R2008a) environment. The current directory is `/media/Transcend/source`. The file explorer shows several M-files: `g4.m`, `g5.m`, `ode_g1.m`, `ode_g2.m`, `ode_g3.m`, `ode_g4.m`, and `ode_g5.m`. The Command Window displays the following code and output:

```
This is a Classroom License for instructional use only.  
Research and commercial use is prohibited.  
>> type ode_g1.m  
  
% plot analytical and numerical solutions  
% [a, b] = [2. 4]  
% initial condition y=f(2)=0.5  
[x, num_y]=ode23('g1', 2,4,0.5);  
y=x.^3-7.5;  
subplot(2,1,1),plot(x,num_y,x,y,'o'),...  
title('Solution to Equation 1'),...  
xlabel('x'), ylabel('y=f(x)'), grid  
>>
```

The Command History window shows the following commands and their outputs:

```
trapez(Y,2)  
Y = [1 2 3; 10  
trapez(Y,2)  
%-- 4/19/10 2:1  
%-- 4/26/10 8:4  
type ode_g1.m
```

and
Engineering
Computing,
BIL108E

Celikoğlu,
Karaman

HIGHER ORDER DIFFERENTIAL EQUATIONS:

- A higher order differential equation can be written as a system of coupled first-order differential equations using a change of variables.
- n^{th} order differential equation:

$$y(n) = g(x, y, y', y'', \dots, y^{(n-1)})$$

- Define n new unknown functions with these equations
 - $u_1(x) = y^{(n-1)}$
 - $u_2(x) = y^{(n-2)}$
 - ...
 - $u_{n-2}(x) = y''$
 - $u_{n-1}(x) = y'$
 - $u_n(x) = y$

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

HIGHER ORDER DIFFERENTIAL EQUATIONS:

- The system of n first-order equations is equivalent to the n th order differential equation.
 - $u_1' = y^{(n)} = g(x, u_n, u_{n-1}, \dots, u_1)$
 - $u_2' = u_1$
 - ...
 - $u_{n-2}' = u_{n-3}$
 - $u_{n-1}' = u_{n-2}$

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

EXAMPLE

- $y'' = g(x, y, y') = y'(1 - y^2) - y$
- Define two new functions
 - $u_1(x) = y'$
 - $u_2(x) = y$
- Obtain this system of coupled first-order differential equations
 - $u_1' = y'' = g(x, u_2, u_1) = u_1(1 - u_2^2) - u_2$
 - $u_2' = u_1$

ORDINARY DIFFERENTIAL EQUATIONS

Introduction
to Scientific
and
Engineering
Computing,
BIL108E

Çelikoğlu,
Karaman

EXAMPLE

- Matlab ode functions return solutions for each of the first order differential equations.
- First we define a function to compute values of the first-order differential equations.
- Then, to solve the system of first-order differential equations over the interval $[0, 20]$ we use initial conditions of $y'(0) = 0.0$ and $y(0) = 0.25$.

MATLAB ODE FUNCTIONS

Solver	problem type	Order of accuracy	When to use
ode45	nonstiff	medium	This should be the first solver you try. If using crude error tolerances or solving moderately stiff problems.
ode23	nonstiff	low	
ode113	nonstiff	low to high	If using stringent error tolerances or solving a computationally intensive ODE file.
ode15s	stiff	low to medium	If ode45 is slow because the problem is stiff. If using crude error tolerances to solve stiff systems and the mass matrix is constant.
ode23s	stiff	low	
ode23t	moderately stiff	low	If the problem is only moderately stiff and you need a solution without numerical damping.
ode23tb	stiff	low	If using crude error tolerances to solve stiff systems.
