

11

Generic Programming (with STL in C++)

434

Generic Programming 11

Standard Template Library

Nesneye dayalı programlamada, verinin birincil önemine sahip programlama birimi olduğunu belirtmişik. Veri, fizikselli yada soyut bir çok büyülüğu modelleyebilir. Bu model oldukça basit yada karmaşık olabilir. Her nasıl olursa olsun, veri mutlaka bellekte saklanmaktadır ve veriye benzer biçimlerde erişilmektedir. C++, oldukça karmaşık veri tiplerini ve yapılarını oluşturamamızı olanak sağlayan mekanizmlara sahiptir. Genel olarak, programların, bu veri yapılarına belirli bazı biçimlerde eriştiğini biliyoruz:

array, list, stack, queue, vector, map, ...

STL kütüphanesi verinin bellekteki organizasyonuna, erişimine ve işlenmesine yönelik çeşitli yöntemler sunmaktadır. Bu bölümde bu yöntemleri inceleyeceğiz.

Object Oriented Programming

435

Generic Programming 11

Standard Template Library (STL) Hewlett Packard'ın Palo Alto (California)'daki laboratuvarlarında Alexander Stepanov ve Meng Lee tarafından geliştirilmiştir.

1970'lerin sonlarında Alexander Stepanov bir kısım algoritmaların veri yapısının nasıl depolandıklarından bağımsız olduklarını gözlemledi. Örneğin, sıralama algoritmalarında sıralanacak sayıların bir dizide mi? yoksa bir listede mi? bulunduğuğun bir önemi yoktur. Değişen sadece bir sonraki elemana nasıl eriştiği ile ilgildir. Stepanov bu ve benzeri algoritmaları inceleyerek, algoritmaları veri yapısından bağımsız olarak performanstan ödün vermeksiz soyutlamayı başarmıştır. Bu fikrini 1985'de Generic ADA dilinde gerçekleştirmiştir. Ancak o dönemde henüz C++'da bir önceki bölümde incelediğimiz Template yapısı bulunmadığı için bu fikrini C++'da ancak 1992 yılında gerçekleştirememiştir.

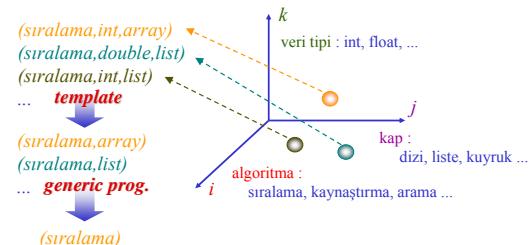

Object Oriented Programming

436

Generic Programming 11

Generic Programming

Bir yazılım ürününün bileşenlerini, üç boyutlu uzaya bir nokta olarak düşünebiliriz :

Object Oriented Programming

437

Generic Programming 11

STL Bileşenleri

STL üç temel bileşenden oluşmaktadır:

- **Algoritma**,
- **Kap (Container)**: nesneleri depolamak ve yönetmekten sorumlu nesne,
 - Lineer Kaplar : Vector, Deque, List
 - Asosyatif Kaplar : Set, Map, Multi-set, Multi-map
- **Yineleyici (Iterator)**: algoritmanın farklı tipte kaplarla çalışmasını sağlayacak şekilde erişimin soyutları.

Object Oriented Programming

438

Generic Programming 11

Kaplar

Container	Description	Required Header
bitset	A set of bits	<bitset>
deque	A double-ended queue	<deque>
list	A linear list	<list>
map	Stores key/value pairs in which each key is associated with only one value	<map>
multimap	Stores key/value pairs in which one key may be associated with two or more values	<map>
multiset	A set in which each element is not necessarily unique	<set>
priority_queue	A priority queue	<queue>
queue	A queue	<queue>
set	A set in which each element is unique	<set>
stack	A stack	<stack>
vector	A dynamic array	<vector>

Object Oriented Programming

439

C++'da sabit boyutlu dizi tanımlamak yürütme zamanında belleğin ya kötü kullanılmasına yada dizi boyunun yetersiz kalmasına neden olmaktadır.

STL kütüphanesindeki `vector` kabı bu sorunları gidermektedir.

STL kütüphanesindeki `list` kabı, bağlantı liste yapısıdır.

`deque` (*Double-Ended Queue*) kabı, yığın ve kuyruk yapılarının birleşimi olarak düşünülebilir. `deque` kabı her iki uçtan veri eklemeye ve silmeye olanak sağlamaktadır.

Vector	Relocating, expandable array	Quick random access (by index number). Slow to insert or erase in the middle.
List	Doubly linked list	Quick to insert or delete at any location. Quick access to both ends.
Deque	Like vector, but can be accessed at either end	Quick random access (using index number). Slow to insert or erase in the middle. Quick to insert or erase (push and pop) at either the beginning or the end.

Vector

► #include <vector>

► Kurucular

- Boş: `vector<string> object;`
- Belirli sayıda eleman:
 - `vector<string> object(5,string("hello"));`
 - `vector<string> container(10)`
 - `vector<string> object(&container[5], &container[9]);`
 - `vector<string> object(container);`

Vector Member Functions

- Type `&vector::back()`: returns the reference to the last element
- Type `&vector::front()`: returns the reference to the first element
- `vector::iterator vector::begin()`
- `vector::iterator vector::end()`
- `vector::clear()`
- `bool vector::empty()`
- `vector::iterator vector::erase()`
 - `erase(pos)`
 - `erase(first,beyond)`

Vector Member Functions

- `vector::insert`
 - `vector::iterator insert(pos)`
 - `vector::iterator insert(pos,value)`
 - `vector::iterator insert(pos,first,beyond)`
 - `vector::iterator insert(pos,n,value)`
- `void vector::pop_back()`
- `void vector::push_back(value)`
- `vector::resize()`
 - `resize(n,value)`
- `vector::swap()`
 - `vector<int> v1(7),v2(10);`
 - `v1.swap(v2);`
- `unsigned vector::size()`

Örnek

```
vector<int> v;
cout << v.capacity() << v.size() ;
v.insert(v.end(),3) ;
cout << v.capacity() << v.size() ;
v.insert (v.begin(), 2, 5);
```

v = (3)

v = (5,5,3)

```
vector<int> w (4,9);
w.insert(w.end(), v.begin(), v.end());
w.swap(v);
```

w = (9,9,9,9)

w = (9,9,9,5,5,3)

v = (9,9,9,5,5,3)

w = (5,3)

```
w.erase(w.begin());
w.erase(w.begin(),w.end());
cout << w.empty() ? "Empty" : "not Empty"
```

w = (5,3)

Empty

```
#define __USE_STL
```

```
// STL include files
```

```
#include <vector>
```

```
#include <list>
```

```
vector<int> v;
```

```
v.insert(v.end(),3) ;
```

```
v.insert(v.begin(),5) ;
```

```
cout << v.front() << endl;
```

```
cout << v.back() ;
```

```
v.pop_back();
```

```
cout << v.back() ;
```

v = (3)

v = (5,3)

5

List

- ▶ `#include <list>`
- ▶ Eklenecek eleman sayısı belirli olmadığı durumlarda uygundur
- ▶ Kurucular
 - Boş: `list<string> object;`
 - Belirli sayıda eleman:
 - `list<string> container(5, string("hello"));`
 - `list<string> container(10);`
 - `list<string> object(&container[5], &container[9]);`
 - `list<string> object(container);`

List Member Functions

- ▶ Type `&list::back()`: returns the reference to the last element
- ▶ Type `&list::front()`: returns the reference to the first element
- ▶ `list::iterator list::begin()`
- ▶ `list::iterator list::end()`
- ▶ `list::clear()`
- ▶ `bool list::empty()`
- ▶ `list::iterator list::erase()`
 - `erase(pos)`
 - `erase(first,beyond)`

List Member Functions

- ▶ `list::insert`
 - `list::iterator insert(pos)`
 - `list::iterator insert(pos,value)`
 - `list::iterator insert(pos,first,beyond)`
 - `list::iterator insert(pos,n,value)`
- ▶ `void list::pop_back()`
- ▶ `void list::push_back(value)`
- ▶ `list::resize()`
 - `resize(n,value)`
- ▶ `void list<type>::merge(list<type> other)`
- ▶ `void list<type>::remove(value)`
- ▶ `unsigned list::size()`

List Member Functions

- ▶ `list::sort()`
- ▶ `void list::splice(pos,object)`
- ▶ `void list::unique()`: operates on sorted list, removes consecutive identical elements

Queue

- ▶ `#include <queue>`
- ▶ FIFO (=First In First Out)
- ▶ Kurucular
 - Boş: `queue<string> object;`
 - Kopya Kurucu: `queue<string> object(container);`

Queue Member Functions

- ▶ Type `&queue::back()`: returns the reference to the last element
- ▶ Type `&queue::front()`: returns the reference to the first element
- ▶ `bool queue::empty()`
- ▶ `void queue::push(value)`
- ▶ `void queue::pop()`

Priority_Queue

- ▶ #include <queue>
- ▶ Temel olarak queue ile aynı
- ▶ Kuyruğa ekleme belirli bir önceliğe göre yürütülür
- ▶ Öncelik: operator<()

 pqueue1.cpp

 pqueue2.cpp

Priority_Queue Member Functions

- ▶ Type &queue::back(): returns the reference to the last element
- ▶ Type &queue::front(): returns the reference to the first element
- ▶ bool queue::empty()
- ▶ void queue::push(value)
- ▶ void queue::pop()

Deque

- ▶ #include <deque>
- ▶ Head & Tail, Doubly Linked
- ▶ deque<string> object
 - deque<string> object(5,string("hello"));
 - deque<string> container(10)
 - deque<string> object(&container[5], &container[9]);
 - deque<string> object(container);

Deque Member Functions

- ▶ Type &deque::back(): returns the reference to the last element
- ▶ Type &deque::front(): returns the reference to the first element
- ▶ deque::iterator deque::begin()
- ▶ deque::iterator deque::end()
- ▶ deque::clear()
- ▶ bool deque::empty()
- ▶ deque::iterator deque::erase()
 - erase(pos)
 - erase(first,beyond)

Deque Member Functions

- ▶ vector::insert
 - deque::iterator insert(pos)
 - deque::iterator insert(pos,value)
 - deque::iterator insert(pos,first,beyond)
 - deque::iterator insert(pos,n,value)
- ▶ void deque::pop_back()
- ▶ void deque::push_back(value)
- ▶ deque::resize()
 - resize(n,value)
- ▶ deque::swap()
- ▶ unsigned deque::size()

Asosyatif Kaplar: Set, Multiset, Map, Multimap

- ▶ Set sıralı küme oluşturmak için kullanılır.
- ```
#include <set>
using namespace std;
int main(){
 string names[] = {"Katie", "Robert", "Mary", "Amanda", "Marie"};
 set<string> nameSet(names, names+5); // initialize set to array
 set<string>::const_iterator iter; // iterator to set
 nameSet.insert("Jack"); // insert some more names
 nameSet.insert("Larry");
 nameSet.insert("Robert"); // no effect; already in set
 nameSet.insert("Barry");
 nameSet.erase("Mary"); // erase a name
}
```

```

cout << "\nSize=" << nameSet.size() << endl;
iter = nameSet.begin(); // display members of set
while(iter != nameSet.end())
 cout << *iter++ << '\n';
string searchName; // get name from user
cout << "\nEnter name to search for: ";
cin >> searchName; // find matching name in set
iter = nameSet.find(searchName);
if(iter == nameSet.end())
 cout << "The name" << searchName << " is NOT in the set.";
else
 cout << "The name " << *iter << " IS in the set.";
}

```

```

// set2.cpp set
int main() {
 set<string> city;
 city.insert("Trabzon"); // insert city names
 city.insert("Adana");
 city.insert("Edirne");
 city.insert("Bursa");
 city.insert("Istanbul");
 city.insert("Rize");
 city.insert("Antalya");
 city.insert("Izmir");
 city.insert("Hatay");
 city.insert("Ankara");
 city.insert("Zonguldak");
}

```

```

iter = city.begin(); // display set
while(iter != city.end())
 cout << *iter++ << endl;

string lower, upper; // display entries in range
cout << "\nEnter range (example A Azz): ";
cin >> lower >> upper;
iter = city.lower_bound(lower);
while(iter != city.upper_bound(upper))
 cout << *iter++ << endl;
}

```

**Map**

- ▶ #include <map>
- ▶ Key/Value pairs
- ▶ map<string,int> object
  - pair<string,int>
 

```
pa[] = {
 pair<string,int>("one",1),
 pair<string,int>("two",2),
 pair<string,int>("three",3),
 pair<string,int>("four",4)
 };
```
  - map<string,int> object(&pa[0],&pa[3]);
- ▶ object["two"]

## Map Member Functions

- ▶ map::insert
  - pair<map::iterator,bool> insert(key,value)
  - pair<map::iterator,bool> insert(pos,key,value)
  - void insert(first,beyond)
- ▶ map::iterator map::lower\_bound(key)
- ▶ map::iterator map::upper\_bound(key)
- ▶ pair<map::iterator,map::iterator> map::equal\_range(key)
- ▶ map::iterator map::find(key)
  - returns map::end() if not found
- ▶ unsigned deque::size()

- ## Map Member Functions
- ▶ map::iterator map::begin()
  - ▶ map::iterator map::end()
  - ▶ map::clear()
  - ▶ bool map::empty()
  - ▶ map::iterator map::erase()
    - erase(key,value)
    - erase(pos)
    - erase(first,beyond)

Generic Programming 11

```

int main(){
 map<string,int> city_num;
 city_num["Trabzon"] = 61;
 ...
 string city_name;
 cout << "\nEnter a city: ";
 cin >> city_name;
 if(city_num.end() == city_num.find(city_name))
 cout << city_name << " is not in the database" << endl;
 else
 cout << "Number of " << city_name << ": " << city_num[city_name];
}

```

Object Oriented Programming 464

## Örnek

## MultiMap

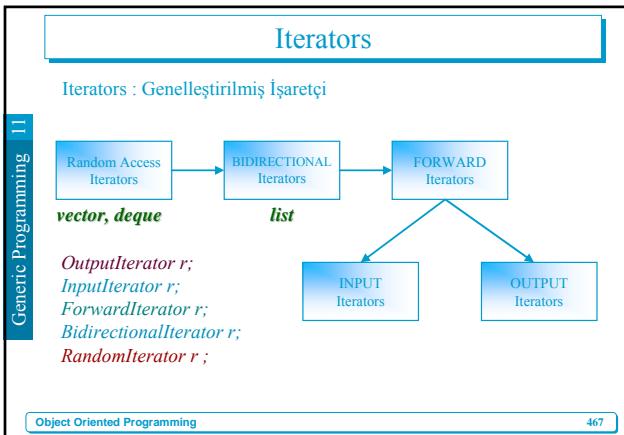

- Generic Programming 11
- #include <map>
  - Main difference between map and multimap is that the multimap supports multiple entries of values having the same keys and the same values.
- Object Oriented Programming 465

Generic Programming 11

Object Oriented Programming 468

## Iterator Capability

## Forward and Bidirectional Iterators

```

 list<int> l(1,1);
 l.push_back(2); // list l : 1 2
 list<int>::iterator first=l.begin();
 list<int>::iterator last=l.end();
 while(last != first){
 --last;
 cout << *last << " ";
 }
}

```

Object Oriented Programming      470

## Forward and Bidirectional Iterators

```

template<class ForwardIterator, class T>
ForwardIterator find_linear(ForwardIterator first,
 ForwardIterator last, T& value){
 while(first != last) if(*first++ == value) return first;
 else return last;
}

vector<int> v(3,1);
v.push_back(7); // vector : 1 1 1 7
vector<int>::iterator i=find_linear(v.begin(), v.end(),7);
if(i != v.end()) cout << *i;
else cout << "not found!";

```

Object Oriented Programming      471

## Bubble Sort

```

template<class Compare>
void bubble_sort(BidirectionalIterator first,
 BidirectionalIterator last, Compare comp){
 BidirectionalIterator left = first , right = first ;
 right++;
 while(first != last){
 while(right != last){
 if(comp(*right,*left))
 iter_swap(left,right);
 right++;
 left++;
 }
 last--;
 left = first ; right = first ;
 }
}
list<int> l;
bubble_sort(l.begin(),l.end(),less<int>());
bubble_sort(l.begin(),l.end(),greater<int>());

```

Object Oriented Programming      472

## Random Access Iterators

```

vector<int> v(1,1);
v.push_back(2); v.push_back(3); v.push_back(4); // v : 1 2 3 4
vector<int>::iterator i=v.begin();
vector<int>::iterator j=i+2;
cout << *j << " ";
i += 3; cout << *i << " ";
j = i - 1; cout << *j << " ";
j -= 2; cout << *j << " ";
cout << v[1] << endl ;
(j < i) ? cout << "j < i" : cout << "not j < i" ; cout << endl ;
(j > i) ? cout << "j > i" : cout << "not j > i" ; cout << endl ;
(j == i) && (j <= i)? cout << "j and i equal" : cout << "j and i not equal" ; cout << endl ;
i = j;
j= v.begin();
i = v.end();
cout << "iterator distance end - begin : " << (i-j);

```

Object Oriented Programming      473

## Iterator Operators

- STL provides two functions that return the number of elements between two elements and that jump from one element to any other element in the container:
  - `distance()`
  - `advance()`

Object Oriented Programming      474

## distance()

- The `distance()` function finds the distance between the current position of two iterators.

```

template<class RandomAccessIterator>
iterator_traits<RandomAccessIterator>::difference_type
distance(RandomAccessIterator first, RandomAccessIterator
 last) {
 return last - first;
}
template<class InputIterator>
iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last) {
 iterator_traits<InputIterator>::difference_type n = 0;
 while (first++ != last) ++n;
 return n;
}

```

Object Oriented Programming      475

## advance()

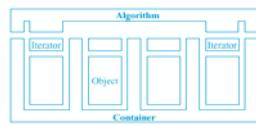

- So far, we have seen how we can move iterators forward and backward by using the increment and decrement operators, respectively. We can also move random access iterators several steps at a time using the addition and subtraction functions. Other types of iterators, however, do not have the addition and subtraction functions.
- The STL provides the advance() function to move any iterator—except the output iterators—several steps at a time:

```
template<class InputIterator, class Distance>
void advance(InputIterator& ii, Distance& n) {
 while (n--) ++ii;
}

template<class BidirectionalIterator, class Distance>
void advance(BidirectionalIterator & bi, Distance& n) {
 if (n >= 0) while (n--) ++bi;
 else while (n++) --bi;
}

template<class RandomAccessIterator, class Distance>
void advance(RandomAccessIterator& ri, Distance& n) {
 ri += n;
}
```

## Designing Generic Algorithm

implementing an algorithm such as computing the maximum value in a sequence can be done without knowing the details of how values are stored in that sequence:

```
template <class Iterator>
Iterator max_element(Iterator beg, // refers to start of collection
 Iterator end) // refers to end of collection
{
 ...
}
```

## Binary Search for Integer Array

```
const int * binary_search(const int * array, int n, int x){
 const int *lo = array, *hi = array + n , *mid ;
 while(lo != hi) {
 mid = lo + (hi-lo)/2 ;
 if(x == *mid) return mid ;
 if(x < *mid) hi = mid ;
 else lo = mid + 1 ;
 }
 return 0 ;
}
```

## Binary Search—Template Solution (Form-1)

```
template<class T>
const T * binary_search(const T * array, int n, T& x){
 const T *lo = array, *hi = array + n , *mid ;
 while(lo != hi) {
 mid = lo + (hi-lo)/2 ;
 if(x == *mid) return mid ;
 if(x < *mid) hi = mid ;
 else lo = mid + 1 ;
 }
 return 0 ;
}
```

## Binary Search—Template Solution (Form-2)

```
template<class T>
const T * binary_search(T * first,T * last, T& x){
 const T *lo = first, *hi = last , *mid ;
 while(lo != hi) {
 mid = lo + (hi-lo)/2 ;
 if(x == *mid) return mid ;
 if(x < *mid) hi = mid ;
 else lo = mid + 1 ;
 }
 return last ;
}
```

## Generic Binary Search

```
template<class RandomAccessIterator, class T>
const T * binary_search(RandomAccessIterator first,
 RandomAccessIterator last, T& value){
 RandomAccessIterator not_found = last, mid;
 RandomAccessIterator lo= first, hi=last ;
 while(lo != hi) {
 mid = lo + (hi-lo)/2 ;
 if(value == *mid) return mid ;
 if(value < *mid) hi = mid ;
 else lo = mid + 1 ;
 }
 return not_found ;
}
```

Object Oriented Programming 482

## STL Algorithms

| Algorithm  | Purpose                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------|
| find       | Returns first element equivalent to a specified value                                                        |
| count      | Counts the number of elements that have a specified value                                                    |
| equal      | Compares the contents of two containers and returns true if all corresponding elements are equal             |
| search     | Looks for a sequence of values in one container that correspond with the same sequence in another container  |
| copy       | Copies a sequence of values from one container to another (or to a different location in the same container) |
| swap       | Exchanges a value in one location with a value in another                                                    |
| iter_swap  | Exchanges a sequence of values in one location with a sequence of values in another location                 |
| fill       | Copies a value into a sequence of locations                                                                  |
| sort       | Sorts the values in a container according to a specified ordering                                            |
| merge      | Combines two sorted ranges of elements to make a larger sorted range                                         |
| accumulate | Returns the sum of the elements in a given range                                                             |
| for_each   | Executes a specified function for each element in the container                                              |

Generic Programming 11 #include <algorithm> Object Oriented Programming 483

## find()

- The find() algorithm looks for the first element in a container that has a specified value.
- find() example program shows how this looks when we're trying to find a value in an array of int's.

Object Oriented Programming 484

## Example

```
#include <iostream>
#include <algorithm> //for find()
int arr[] = { 11, 22, 33, 44, 55, 66, 77, 88 };
int main() {
 int* ptr;
 ptr = find(arr, arr+8, 33); //find first 33
 cout << "First object with value 33 found at offset "
 << (ptr-arr) << endl;
 return 0;
}
```

Generic Programming 11 Object Oriented Programming 485

## count()

- count() counts how many elements in a container have a specified value and returns this number.

```
#include <iostream>
#include <algorithm> //for count()
int arr[] = { 33, 22, 33, 44, 33, 55, 66, 77 };

int main(){
 int n = count(arr, arr+8, 33); //count number of 33's
 cout << "There are " << n << " 33's in arr." << endl;
 return 0;
}
```

Generic Programming 11 Object Oriented Programming 486

## count\_if()

- size\_t count\_if(InputIterator first, InputIterator last, Predicate predicate)

```
#include <vector>
#include <algorithm> //for count_if()
int a[] = { 1, 2, 3, 4, 3, 4, 2, 1, 3 };
class Odd {
public:
 bool operator()(int val){ return val&1 ; }
};
int main(){
 std::vector<int> iv(a,a+9);
 std::cout << count_if(iv.begin(),iv.end(),Odd());
 return 0 ;
}
```

Generic Programming 11 Object Oriented Programming 487

## equal()

- ▶ `bool equal(InputIterator first, InputIterator last,  
InputIterator otherFirst)`
- ▶ `bool equal(InputIterator first, InputIterator last,  
InputIterator otherFirst,Predicate predicate)`

```
class CaseString {
public:
 bool operator()(string const &first,string const &second){
 return !strcasecmp(first.c_str(),second.c_str());
 }
};

int main(){
 string
 first[]={"Alpha","bravo","Charley","echo","Delta","golf"};
 second[]={"alpha","Bravo","charley","Echo","delta","Golf"} ;
 std::string *last = first + sizeof(first)/sizeof(std::string);
 cout << (equal(first,last,second))?"Equal":"Not equal";
 cout << (equal(first,last,CaseString()))?"Equal":
 "Not equal";
 return 0 ;
}
```

## fill(),fill\_n()

- ▶ `void fill(ForwardIterator first,ForwardIterator last,  
Type const &value)`

```
vector<int> iv(8);
fill(iv.begin(),iv.end(),8);
```
- ▶ `void fill_n(ForwardIterator first,Size n,  
Type const &value)`

```
vector<int> iv(8);
fill_n(iv.begin() + 2,4,8);
```

## sort()

- ▶ You can guess what the `sort()` algorithm does.  
Here's an example:

```
#include <iostream>
#include <algorithm>
int arr[] = {45, 2, 22, -17, 0, -30, 25, 55};
int main()
{
 sort(arr, arr+8); //sort the numbers
 for(int j=0; j<8; j++) //display sorted array
 cout << arr[j] << ' ';
 return 0;
}
```

## search()

- ▶ Some algorithms operate on two containers at once. For instance, while the `find()` algorithm looks for a specified value in a single container, the `search()` algorithm looks for a sequence of values, specified by one container, within another container.

```
int source[] = { 11, 44, 33, 11, 22, 33, 11, 22, 44 };
int pattern[] = { 11, 22, 33 };
int main(){
 int* ptr;
 ptr = search(source, source+9, pattern, pattern+3);
 if(ptr == source+9) cout << "No match found\n";
 else cout << "Match at " << (ptr - source);
 return 0;
}
```

## binary\_search()

- ▶ `#include <algorithm>`
  - `bool binary_search(ForwardIterator first, ForwardIterator last,Type const &value)`
  - `bool binary_search(ForwardIterator first, ForwardIterator last,Type const &value,Comparator comp)`

## merge()

```
#include <iostream>
#include <algorithm> //for merge()
using namespace std;
int src1[] = { 2, 3, 4, 6, 8 };
int src2[] = { 1, 3, 5 };
int dest[8];
int main(){ //merge src1 and src2 into dest
 merge(src1, src1+5, src2, src2+3, dest);
 for (int j=0; j<8; j++) //display dest
 cout << dest[j] << ' ';
 cout << endl;
 return 0;
}
```

## accumulate()

- #include <numeric>
  - Type accumulate(InputIterator first, InputIterator last, Type init)
    - operator+( ) is applied to all elements and the result is returned
  - Type accumulate(InputIterator first, InputIterator last, Type init, BinaryOperation op)
    - binary operator op( ) is applied to all elements

```
#include <iostream>
#include <numeric>
#include <vector>

int main(){
 int ia[]={1,2,3,4} ;
 std::vector<int> iv(ia,ia+4);

 cout << accumulate(iv.begin(),iv.end(),int()) << std::endl ;
 cout << accumulate(iv.begin(),iv.end(),int(1),multiplies<int>())
 << endl ;
 system("pause");
 return 0 ;
}
```

## adjacent\_difference()

- #include <numeric>
  - OutputIterator adjacent\_difference(InputIterator first, InputIterator last, OutputOperator result)
  - OutputIterator adjacent\_difference(InputIterator first, InputIterator last, OutputOperator result, BinaryOperation op)

```
#include <iostream>
#include <numeric>
#include <vector>
int main(){
 int ia[]={1,3,7,23} ;
 std::vector<int> iv(ia,ia+4) ;
 std::vector<int> ov(iv.size());
 adjacent_difference(iv.begin(),iv.end(),ov.begin());
 copy(ov.begin(),ov.end(),std::ostream_iterator<int>(cout, " "));
 std::cout << std::endl ;

 adjacent_difference(iv.begin(),iv.end(),ov.begin(),minus<int>());
 copy(ov.begin(),ov.end(),ostream_iterator<int>(cout, " "));
 system("pause");
 return 0 ;
}
```

## copy(), copy\_backward()

- #include <algorithm>
  - OutputIterator copy(InputIterator first, InputIterator last, OutputIterator destination)
  - BidirectionalIterator copy(InputIterator first, InputIterator last, BidirectionalIterator last2)

## for\_each

► Function for\_each(ForwardIterator first, ForwardIterator last,Function func)

```

void lowerCase(char &c){
 c = static_cast<char>(tolower(c));
}

void capitalizedOutput(std::string const &str){
 char *tmp = strcpy(new char[str.size() + 1], str.c_str());
 std::for_each(tmp + 1, tmp + str.size(), lowerCase);

 tmp[0] = toupper(*tmp);
 std::cout << tmp << " ";
 delete []tmp;
}

```

 foreach1.cpp

Object Oriented Programming 500

Generic Programming 11

```

int main(){
 std::string
 sarr[] =
 {
 "alpha", "BRAVO", "charley", "ECHO", "delta",
 "FOXTROT", "golf", "HOTEL"
 },
 *last = sarr + sizeof(sarr) / sizeof(std::string);
 void (*f)(std::string const&);

 f = std::for_each(sarr, last, capitalizedOutput);
 std::cout << std::endl;
 f("alpha");
 std::cout << std::endl;
 system("pause");
 return 0;
}

```

Object Oriented Programming 501

Generic Programming 11

## Another Example

```

class Show{
 int d_count;
public:
 void operator()(std::string &str){
 for_each(str.begin(), str.end(), lowerCase);
 str[0] = toupper(str[0]);
 std::cout << ++d_count << " " << str << ", ";
 }
 int getCount() const{
 return d_count;
 }
};

```

 foreach2.cpp

Object Oriented Programming 502

Generic Programming 11

```

int main(){
 std::string
 sarr[] =
 {
 "alpha", "BRAVO", "charley", "ECHO", "delta",
 "FOXTROT", "golf", "HOTEL"
 },
 *last = sarr + sizeof(sarr) / sizeof(std::string);
 cout << for_each(sarr, last, Show()).getCount() << endl;
 system("pause");
 return 0;
}

```

Object Oriented Programming 503

Generic Programming 11

## transform()

```

int _3_n_plus_1(int n) {
 return (n & 1) ? 3*n+1 : n/2;
}

void show(int n) {
 std::cout << n << " ";
}

int main(){
 int iArr[] = { 5,2,23,76,33,44 };
 std::for_each(iArr, iArr+6, show); std::cout << std::endl;
 std::transform(iArr, iArr+6, iArr, _3_n_plus_1);
 std::for_each(iArr, iArr+6, show);
 system("pause");
 return 0;
}

```

 transform.cpp

Generic Programming 11

## Predicates in <functional>

- When the type of the return value of a unary function object is bool, the function is called a unary predicate. A binary function object that returns a bool value is called a binary predicate.
- The Standard C++ Library defines several common predicates in <functional>

Object Oriented Programming 505

**TABLE . PREDICATES DEFINED IN <functional>**

| Function                   | Type   | Description                       |
|----------------------------|--------|-----------------------------------|
| <code>equal_to</code>      | binary | <code>arg1 == arg2</code>         |
| <code>not_equal_to</code>  | binary | <code>arg1 != arg2</code>         |
| <code>greater</code>       | binary | <code>arg1 &gt; arg2</code>       |
| <code>greater_equal</code> | binary | <code>arg1 &gt;= arg2</code>      |
| <code>less</code>          | binary | <code>arg1 &lt; arg2</code>       |
| <code>less_equal</code>    | binary | <code>arg1 &lt;= arg2</code>      |
| <code>logical_and</code>   | binary | <code>arg1 &amp;&amp; arg2</code> |
| <code>logical_or</code>    | binary | <code>arg1    arg2</code>         |
| <code>logical_not</code>   | unary  | <code>!arg1</code>                |

```
template<class T>
class equal_to : binary_function<T, T, bool> {
 bool operator()(T& arg1, T& arg2) const { return arg1 == arg2; }
};
```
