

Purpose of the Course

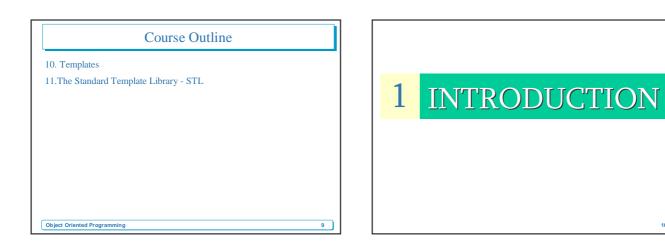

- ► To introduce several programming paradigms including Object-Oriented Programming, Generic Programming, Design Patterns
- ▶ To show how to use these programming schemes with the C++ programming language to build "good" programs.

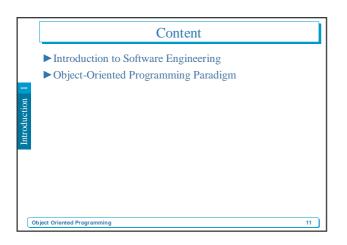

Object Oriented Programming

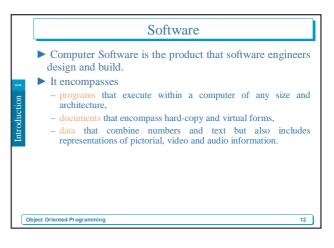

Course Outline 1. Introduction to Object Oriented Programming. 2. C++: A Better C. 3. Classes and Objects 4. Constructors and Destructors

- 5. Operator Overloading 6. Inheritance
- 7. Pointers to Objects
- 8. Polymorphism
- 9. Exceptions

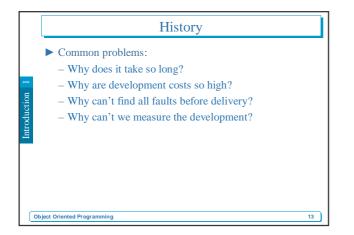

Object Oriented Programming

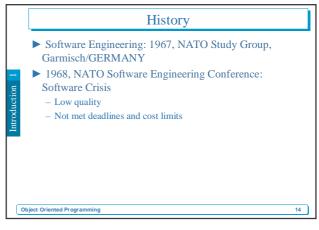

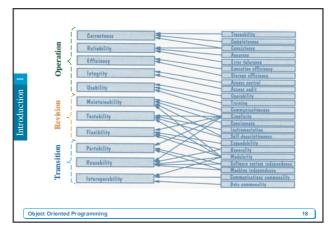

10

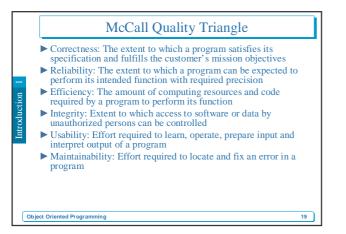

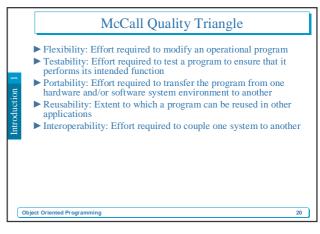

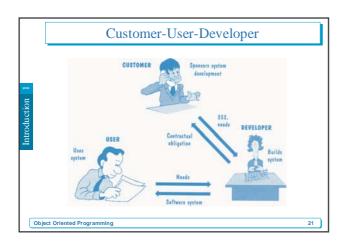

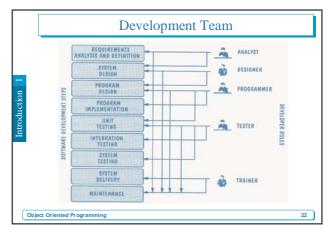

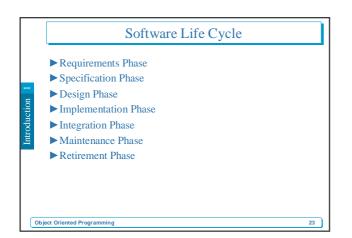

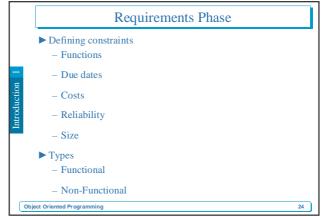

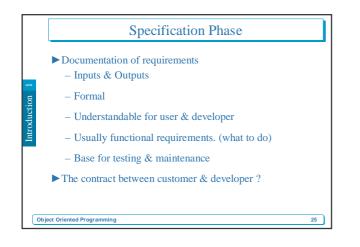

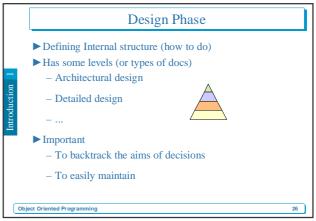

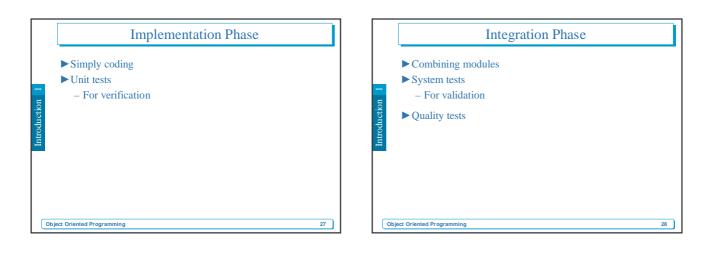

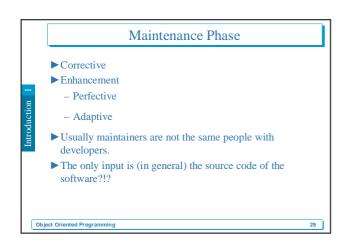

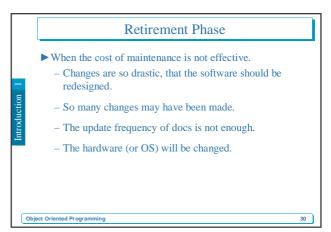

Why Object Technology?

► Expectations are,

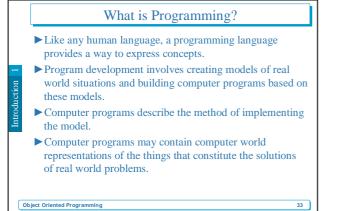

Object Oriented Programming

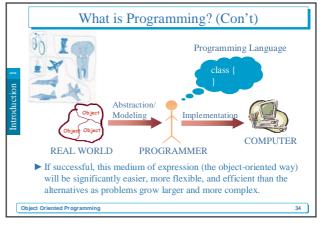

Reducing the effort, complexity, and cost of development and maintenance of software systems.

31

- Reducing the time to adapt an existing system (quicker reaction to changes in the business environment). Flexibility, reusability.
- ► Increasing the reliability of the system.

Why C++ ► C++ supports writing high quality programs (supports OO) ► C++ is used by hundreds of thousands of programmers in every application domain. This use is supported by hundreds of libraries, hundreds of textbooks, several technical journals, many conferences. ► Application domain: Introd Systems programming: Operating systems, device drivers. Here, direct manipulation of hardware under real-time constraints are important. Banking, trading, insurance: Maintainability, ease of extension, ease of testing and reliability is important. Graphics and user interface programs - Computer Communication Programs Object Oriented Programming 32

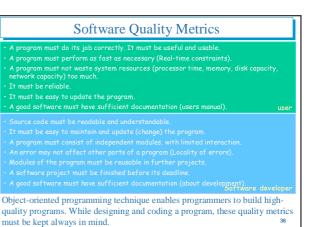

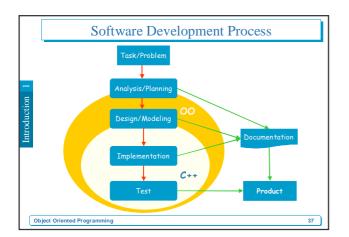

Learning C++

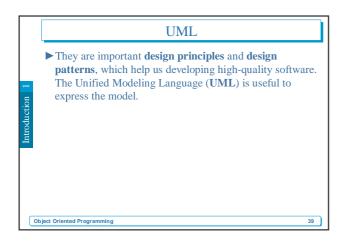

- Like human languages, programming languages also have many syntax and grammar rules.
- Knowledge about grammar rules of a programming language is not enough to write "good" programs.
- ► The most important thing to do when learning C++ is to focus on concepts and not get lost in language-technical details.
- Design techniques is far more important than an understanding of details; that understanding comes with time and practice.
- ► Before the rules of the programming language, the programming scheme must be understood.
- ► Your purpose in learning C++ must not be simply to learn a new syntax for doing things the way you used to, but to learn new and better ways of building systems

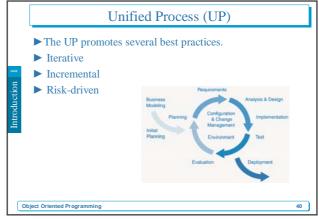

Object Oriented Programming

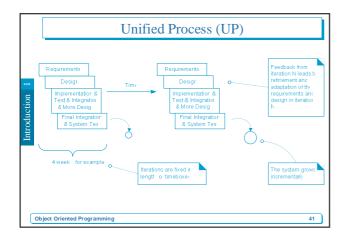

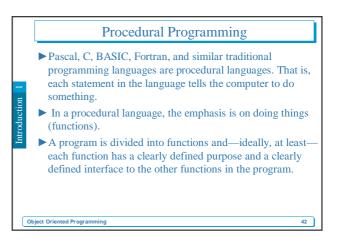

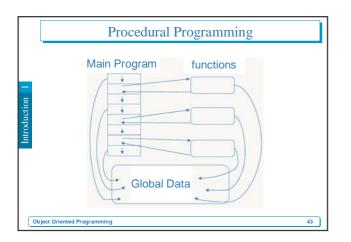

- Analysis: Gaining a clear understanding of the problem. Understanding requirements. They may change during (or after) development of the system!
- ► Building the programming team.
- Design: Identifying the key concepts involved in a solution. Models of the key concepts are created. This stage has a strong effect on the quality of the software. Therefore, before the coding, verification of the created model must be done.
- ► Design process is connected with the programming scheme. Here, our design style is object-oriented.
- Coding: The solution (model) is expressed in a program.
- Coding is connected with the programming language. In this course we will use C++.
- ► Documentation: Each phase of a software project must be clearly explained. A users manual should be also written.
- ► Test: the behavior of the program for possible inputs must be examined. Object Oriented Programming 38

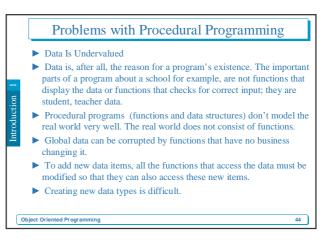

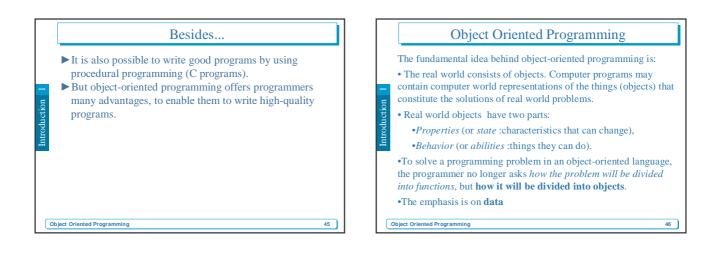

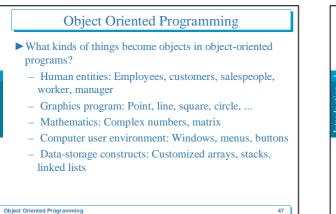

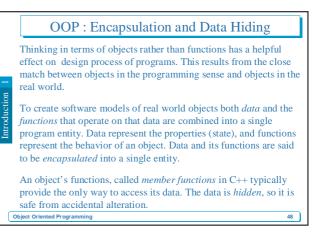

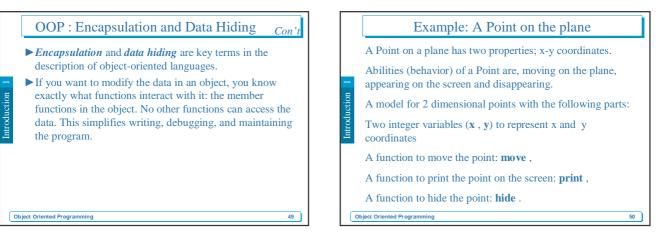

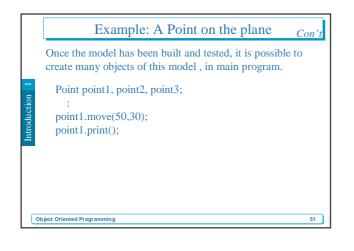

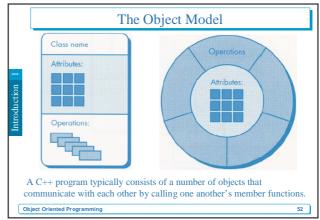

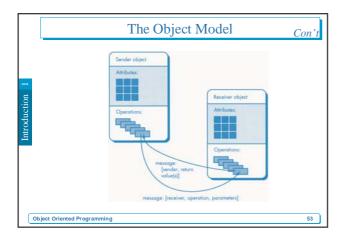

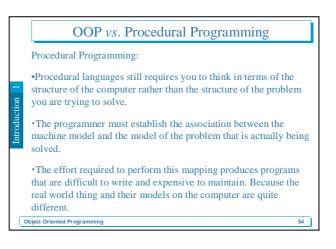

Example: Procedural Programming Con't

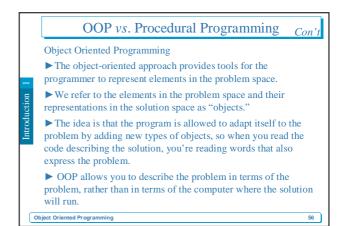

► Real world thing: student

Introduction

Object Oriented Programming

- ► Computer model: char *, int, float ...
- ► It is said that the C language is closer to the computer than the problem.

55

	OOP vs. Procedural Programming	Con't
Introduction 1	 Benefits of the object-oriented programming: Readability Understandability Low probability of errors Maintenance Reusability Teamwork
