Content

- ▶ Maintaining a sequence set
- ▶ A simple prefix B+ Tree
- ▶ Simple Prefix B+ Tree Maintenance: Insertions and Deletions

B+Trees 12

File Organization

310

Motivation

- ▶ Some applications require two views of a file:

Indexed view :	Sequential view :
Records are indexed by a key	Records can be sequentially accessed in order by key
Direct, indexed access	Sequential access (physically contiguous records)
Interactive, random access	Batch processing (Ex: co-sequential processing)

B+Trees 12

File Organization

311

Example of Applications

- ▶ Student record system in a university
 - Indexed view: access to individual records
 - Sequential view: batch processing when posting grades or when fees are paid
- ▶ Credit card system
 - Indexed view: interactive check of accounts
 - Sequential view: batch processing of payment slips
- ▶ We will look at the following two aspect of the problem:
 1. Maintaining a sequence set: keeping records in sequential order
 2. Adding an index set to the sequence set

B+Trees 12

File Organization

312

Maintaining a Sequence Set

- ▶ Sorting and re-organizing after insertions and deletions is out of question
- ▶ We organize the sequence set in the following way
 - Records are grouped in **blocks**
 - Blocks should be **at least half full**
 - **Link fields** are used to point to the preceding block and the following block (similar to doubly linked list)
 - Changes (inserted/deletion) are localized into blocks by performing:
 1. **Block Splitting** when **insertion** causes overflow
 2. **Block Merging** or **Redistribution** when **deletion** causes underflow

B+Trees 12

File Organization

313

Example

- ▶ Block Size = 4
- ▶ Key = Last Name

B+Trees 12

File Organization

314

Advantages and Disadvantages of Sequence Set

- Advantages
 - No need to re-organize the whole file after insertions/deletions
- Disadvantages
 - File takes more space than unblocked files (since blocks may be half full)
 - The order of the records is not necessarily **physically** sequential (we only guarantee physical sequentiality within a block)

Choosing Block Size

- Main memory constraints (must hold at least 2 blocks)
- Avoid seeking within a block (e.g., in sector formatted disks choose block size equal to cluster size).

Adding an Index Set to the Sequential Set

- Index will contain SEPERATORS instead of KEYS

1	ADAMS...			BERNE...	BO
2	BOLEN...			CAGE...	
3	CAMP...			DUTTON...	CAM
4	EMBRY...			EVANS...	
5	FABER...			FOLK...	F
6	FOLKS...			GADDIS...	

The Simple Prefix B+ Tree

- The **simple prefix B+ tree** consists of
 - **Sequence Set**
 - **Index Set**: similar to a B-tree index, but storing the shortest separators for the sequence set.

Example: Order of the index set is 3

Search in a Simple Prefix B+ Tree

- Search for "EMBRY"
 - Retrieve Node 0 (Root)
 - Since "EMBRY" > "E", so go right, and retrieve Node 2.
 - Since "EMBRY" < "F", so go left, and Block # 4
 - Look for the record with key "EMBRY" in Block # 4

B+ Trees 12

Simple Prefix B+ Tree Maintenance

► Example:

- Sequence set has blocking factor 4
- Index set is a B tree of order 3

Node 1: [H | O] → [A, C, E, G] (1) ↔ [H, J, L, N] (2) ↔ [O, Q, S] (3)

B+ Trees 12

File Organization
327

B+ Trees 12

Example (Cont'd)

- Changes which are local to single blocks in the sequence set
 - Insert "U"
 - Go to the root
 - Go to the right of "O"
 - Insert "U" to Block 3

Node 1: [H | O] → [A, C, E, G] (1) ↔ [H, J, L, N] (2) ↔ [O, Q, S, U] (3)

–There is no change in the index set

B+ Trees 12

File Organization
328

B+ Trees 12

Example (Cont'd)

- Delete "O"
 - Go to the root
 - Go to the right of "O"
 - Delete "O" from Block 3

Node 1: [H | O] → [A, C, E, G] (1) ↔ [H, J, L, N] (2) ↔ [Q, S, U] (3)

–There is no change in the index set: "O" is still a perfect separator for Blocks 2 and 3

B+ Trees 12

File Organization
329

B+ Trees 12

Example (Cont'd)

- Changes involving multiple blocks in the sequence set
 - Delete "S" and "U"
 - Go to the root
 - Go to the right of "O"
 - Delete "S" and "U" from Block 3

Node 1: [H | O] → [A, C, E, G] (1) ↔ [H, J, L, N] (2) ↔ [Q] (3)

–Now Block 3 becomes less than 1/2 full (UNDERFLOW)

B+ Trees 12

File Organization
330

B+ Trees 12

Example (Cont'd)

► Since Block 2 is full, the only position is re-distribution bringing a key from Block 2 to Block 3

► We must update the separator "O" to "N"

Node 1: [H | N] → [A, C, E, G] (1) ↔ [H, J, L] (2) ↔ [N, Q] (3)

B+ Trees 12

File Organization
331

B+ Trees 12

Example (Cont'd)

► Insert "B"

- Go to the root
- Go to the left of "H" to Block 1
- Block 1 would have hold A, B, C, E, G
- Block 1 is split

Node 1: [A | N] → [A, B, C, E, G] (1) ↔ [H, J, L] (2) ↔ [N, Q] (3)

split → [A, B, C] ↔ [E, G]

B+ Trees 12

File Organization
332

Example (Cont'd)

► So this causes Node 1 to split

Node 1: [E | H | N |]

Leaf blocks: 1 (A,B,C) ↔ 4 (E,G) ↔ 2 (H,J,L) ↔ 3 (N,Q)

File Organization 333

Example (Cont'd)

Node 3: [H |]

Node 1: [E |]

Node 2: [N |]

Leaf blocks: 1 (A,B,C) ↔ 4 (E,G) ↔ 2 (H,J,L) ↔ 3 (N,Q)

File Organization 334

Example (Cont'd)

► Insert "F"

Node 3: [H |]

Node 1: [E | F | N |]

Node 2: [N |]

Leaf blocks: 1 (A,B,C) ↔ 4 (E,F,G) ↔ 2 (H,J,L) ↔ 3 (N,Q)

File Organization 335

Example (Cont'd)

► Delete "J" and "L"

Node 3: [H |]

Node 1: [E |]

Node 2: [N |]

Leaf blocks: 1 (A,B,C) ↔ 4 (E,F,G) ↔ 2 (H) ↔ 3 (N,Q)

► This is an UNDERFLOW. You may think to redistribute Blocks 2 and 4: E,F,G,H becomes E,F and G,H.

File Organization 336

Example (Cont'd)

- Why this is not possible?
- Blocks 2 and 4 are not siblings! They are cousins.
- Merge Blocks 2 and 3
- Send Block 3 to AVAIL LIST
- Remove the Link Between Node 2 and Block 3

Node 1: [E |]

Node 2: [N |]

Leaf blocks: 1 (A,B,C) ↔ 4 (E,F,G) ↔ 2 (H,N,Q)

Block 3: []

File Organization 337

Example (Cont'd)

► Send Node 2 and 3 to AVAIL LIST

Node 3: [H |]

Node 1: [E |]

Node 2: [N |]

Leaf blocks: 1 (A,B,C) ↔ 4 (E,F,G) ↔ 2 (H,N,Q)

Block 3: []

File Organization 338

Example (Cont'd)

- Blocks were reunited as a big happy family again ☺
