BINARY SEARCHING, KEYSORTING & INDEXING

Copyright © 2004, Binnur Kurt

Binary Search Algorithm in C++

```
template <typename KeyType,typename RecordType>
bool BinarySearch(FILE *file,RecordType &rec, KeyType &key){
    int low=0,high=getFileLength(file)/sizeof(RecordType)-1 ;
    int guess ;
    while (low<=high){
        guess = (high+low)/2 ;
        readRecord(file,rec,guess) ;
        if (Equal (rec.key(),key)) return true ;
        if (Greater (rec.key(),key)) high = guess-1 ;
        else low = guess+1 ;
    }
    return false;
}
```

TBook

```
typedef struct TBook {
    char author[16] ;
    char title[24] ;
    char isbn[10] ;
    char *key(){return isbn;}
} SBook ;
```

Binary Searching

- ▶ Let us consider fixed-length records that must be searched by a **key value**
- ▶ If we knew the RRN of the record identified by this key value, we could jump directly to the record (by using fseek function)
- ▶ In practice, we do not have this information and we must search for the record containing this key value
- ▶ If the file is not sorted by the key value we may have to look at every possible record before we find the desired record
- ▶ An alternative to this is to maintain the file sorted by **key value** and use **binary searching**

File Organization

Equal()

```
template <typename KeyType>
bool Equal(KeyType key1,KeyType key2){
    if (key1==key2) return true ;
    return false ;
}

bool Equal(char *key1,char *key2){
    return (strcmp(key1,key2)==0) ;
}
```

Introduction to Indexing 8

readRecord

```

template <typename RecordType>
void readRecord(FILE *file, RecordType &rec, int rnn){
    fseek(hFile, rnn * sizeof(RecordType), SEEK_SET);
    fread(&rec, sizeof(RecordType), 1, hFile);
}
        
```

Introduction to Indexing 8

Keysorting

- ▶ Suppose a file needs to be sorted, but it is too big to fit into main memory.
- ▶ To sort the file, we only need the keys.
- ▶ Suppose that all the keys fit into main memory
- ▶ Idea
 - Bring the keys to main memory plus corresponding RRN
 - Do internal sorting of keys
 - Rewrite the file in sorted order

Introduction to Indexing 8

int main()

```

int main(int argc, char* argv[]) {
    FILE *hFile;
    ...
    TBook book;
    BinarySearch(hFile, book, "Da Vinci Code");
    cout << book.author;
    return 0;
}
        
```

Introduction to Indexing 8

Example

keynodes array

key	RRN
HARRISON	0
KELLOG	1
HARRIS	2
BELL	3

Main Memory

records

HARRISON 387 Eastern...
KELLOG 17 Maple...
HARRIS 4343 West...
BELL 8912 Hill...

Disk

Introduction to Indexing 8

Binary Search vs. Sequential Search

- ▶ Sequential Search: $O(n)$
- ▶ Binary Search: $O(\log_2 n)$
- ▶ If file size is doubled, sequential search time is doubled, while binary search time increases by 1

File Organization

210

Introduction to Indexing 8

Example

keynodes array

key	RRN
BELL	3
HARRIS	2
HARRISON	0
KELLOG	1

Internal sorting in main memory

records

HARRISON 387 Eastern...
KELLOG 17 Maple...
HARRIS 4343 West...
BELL 8912 Hill...

No change in Disk

keynodes array

BELL	3
HARRIS	2
HARRISON	0
KELLOG	1

records

BELL 8912 Hill...
HARRIS 4343 West...
HARRISON 387 Eastern...
KELLOG 17 Maple...

create new sorted file to replace previous

Pinned Records

Introduction to Indexing 8

- ▶ Remember that in order to support deletions we used **AVAIL LIST**, a list of available records
- ▶ The **AVAIL LIST** contains info on the physical information of records. In such a file, a record is said to be **pinned**
- ▶ If we use an **index file** for sorting, the **AVAIL LIST** and positions of records remain unchanged.
- ▶ This is a good news 😊

File Organization
217

How much effort we must do?

Introduction to Indexing 8

- ▶ Read file sequentially once
- ▶ Go through each record in random order (seek)
- ▶ Write each record once (sequentially)

File Organization
215

Introduction to Indexing

Introduction to Indexing 8

- ▶ Simple indexes use simple arrays.
- ▶ An index lets us **impose order on a file** without rearranging the file.
- ▶ Indexes provide **multiple access paths** to a file — **multiple indexes** (like library catalog providing search for author, book and title)
- ▶ An index can provide keyed access to variable-length record files

File Organization
218

Why bother to write the file back?

Introduction to Indexing 8

▶ Use keynode array to create an index file instead.

index file

BELL	3
HARRIS	2
HARRISON	0
KELLOG	1

records

HARRISON 387 Eastern...
KELLOG 17 Maple...
HARRIS 4343 West...
BELL 8912 Hill...

leave file unchanged

this is called indexing!

A Simple Index for Entry-Sequenced File

Introduction to Indexing 8

▶ Records (Variable-length)

17	LON 2312 Symphony N.S ...
62	RCA 2626 Quartet in C sharp ...
117	WAR 23699 Adagio ...
152	ANG 3795 Violin Concerto ...

▶ Primary key = company label + record ID

key	reference field
ANG3795	152
LON2312	17
RCA2626	62
WAR23699	117

index:

File Organization
219

Introduction to Indexing 8

Index

- ▶ Index is sorted (main memory)
- ▶ Records appear in file in the order they entered
- ▶ How to search for a recording with given LABEL ID?
 - Binary search (in main memory) in the index: find LABEL ID, which leads us to the referenced field
 - Seek for record in position given by the reference field

File Organization 220

Introduction to Indexing 8

Some Issues

- ▶ How to make a persistent index
 - i.e. how to store the index into a file when it is not in main memory
- ▶ How to guarantee that the index is an accurate reflection of the contents of the file
 - This is tricky when there are lots of additions, deletions and updates
