

4

Expressions & Flow Control

Java Programming

102

Objectives

- ▶ Distinguish between instance and local variables
- ▶ Describe how instance variables are initialized
- ▶ Identify and correct a Possible reference before assignment compiler error
- ▶ Recognize, describe, and use Java operators
- ▶ Distinguish between legal and illegal assignments of primitive types
- ▶ Identify boolean expressions and their requirements in control constructs

Expressions & Flow Control 4

Java Programming

103

- ▶ Recognize assignment compatibility and required casts in fundamental types
- ▶ Use if, switch, for, while, and do constructions and the labeled forms of break and continue as flow control structures in a program

Expressions & Flow Control 4

Java Programming

104

Variables and Scope

- ▶ Local variables are
 - Variables which are defined inside a method and are called *local*, *automatic*, *temporary*, or *stack* variables
 - Created when the method is executed and destroyed when the method is exited
 - Variables that must be initialized before they are used or compile-time errors will occur

Expressions & Flow Control 4

Java Programming

105

Variable Scope Example # 1

```
{
    int x = 12;
    /* only x available */
    {
        int q = 96;
        /* both x & q available */
    }
    /* only x available */
    /* q is out of scope */
}
```

Expressions & Flow Control 4

Java Programming

106

Variable Scope Example # 2

```
public class ScopeExample {
    private int i=1 ;
    public void firstMethod(){
        int i=4, j=5 ;
        this.i = i + j ;
        secondMethod(7) ;
    }
    public void secondMethod(){
        int j=8 ;
        this.i = i + j ;
    }
}
```

Expressions & Flow Control 4

Java Programming

107

Expressions & Flow Control 4

```

public class TestScoping {
    public static void main(String []args){
        ScopeExample scope = new ScopeExample();
        scope.firstMethod() ;
    }
}

```

Java Programming 108

Expressions & Flow Control 4

Initializing Variables

variables defined outside of a method are initialized **automatically**

boolean	false
char	'\u0000' (null)
byte	(byte)0
short	(short)0
int	0
long	0L
float	0.0f
double	0.0d

Java Programming 109

Expressions & Flow Control 4

Initializing Variables

While variables defined outside of a method are initialized automatically, local variables **must** be initialized manually before use:

```

public class doComputation {
    int x = (int) (Math.random() * 100) ;
    int y ;
    int z ;
    if (x > 50){
        y = 9 ;
    }
    z = x + y ;
}

```

Java Programming 110

Expressions & Flow Control 4

Operators

The Java operators are similar in style and function to those of C and C++:

Separator	. [] () ; ,
Associative	Operators
R to L	++ -- + - ~ ! (data type)
L to R	* / %
L to R	+ -
L to R	<< >> >>>
L to R	< > <= >= instanceof
L to R	= = !=

Java Programming 111

Expressions & Flow Control 4

Associative	Operators
R to L	&
L to R	^
L to R	
L to R	&&
L to R	
R to L	?:
R to L	= *= /= %= += -= <<= >>= >>>= &= ^= =

Java Programming 112

Expressions & Flow Control 4

Logical Operators

- The boolean operators are:
 - ! – NOT & – AND
 - | – OR ^ – XOR
- The short-circuit boolean operators are:
 - && – AND || – OR
- You can use these operators as follows:

```

MyDate d ;
if ((d != null) && (d.day > 31)) {
    // do something with d
}

```

Java Programming 113

Expressions & Flow Control 4

Most Java operators are taken from other languages and behave as expected.

Relational and logical operators return a **boolean** result. The value **0** is not automatically interpreted as **false** and non-zero values are not automatically interpreted as **true**.

```
int i = 1 ;
if (i) // generates a compile error
if (i != 0) // correct
```

Java Programming 114

Expressions & Flow Control 4

MyDate d ;
if ((d != null) && (d.day > 31)) {
 // do something with d
}

The second sub-expression is skipped when the first subexpression is false

if ((d != null) && (d.day > 31)) is SAFE

if ((d != null) & (d.day > 31)) is NOT safe

Java Programming 115

Expressions & Flow Control 4

```
import java.io.* ;

public class Evaluate {
    public static void main(String[] args) {
        int a=1,b=1,c=3,d=10,y ;
        y = b + ( a==1 || ++b==d || ++d==11 ? b : d ) + 1 ;
        System.out.println("y=");
        System.out.println(y);
    }
}
```

a=0

Java Programming 116

Expressions & Flow Control 4

Bitwise Logical Operators

- The integer *bitwise* operators are:
 - ~ – Complement & – AND
 - ^ – XOR | – OR
- Byte-sized examples:

0	1	0	0	1	1	1	1	0	0	1	0	1	1	0	1
~								&							
1	0	1	1	0	0	0	0	0	1	0	0	1	1	1	1
								0	0	0	0	1	1	0	1

Java Programming 117

Expressions & Flow Control 4

0	0	1	0	1	1	0	1
^							
0	1	0	0	1	1	1	1
0	1	1	0	0	0	1	0

0	0	1	0	1	1	0	1
0	1	0	0	1	1	1	1
0	1	1	0	1	1	1	1

Java Programming 118

Expressions & Flow Control 4

Right-Shift Operators >> and >>>

- Arithmetic or signed right-shift (>>) is used as follows:
 - 128 >> 1 returns 128/2¹=64
 - 256 >> 4 returns 256/2⁴=16
 - 256 >> 4 returns -256/2⁴=-16
 - The sign bit is copied during the shift.
- A logical or unsigned right-shift (>>>) is:
 - Used for bit patterns.
 - The sign bit is not copied during the shift.

1	0	1	0	1	1	0	1	>> 2 =	1	1	1	0	1	0	1	1
1	0	1	0	1	1	0	1	>>> 2 =	0	0	1	0	1	1	0	1

Java Programming 119

Expressions & Flow Control 4

```

short a, b, c ;
a = 1 ;
b = 2 ;
c = a + b ;    c = (short) (a + b) ;

```

For binary operators, such as the **+** operator, when the two operands are of primitive numeric types, the result is at least an **int** and has a value calculated by promoting the operands to the result type or promoting the result to the wider type of the operands. This might result in **overflow** or **loss of precision**.

Java Programming
126

Expressions & Flow Control 4

Branching Statements

The if, else statement syntax:

```

if (boolean expression) {
    statement or block;
}

if (condition is true) {
    statement or block;
} else {
    statement or block;
}

```

Java Programming
127

Expressions & Flow Control 4

Example

```

int count ;
count = getCount() ;
if (count < 0) {
    System.out.println("Error: count value is negative.");
} else if (count > getMaxCount()) {
    System.out.println("Error: count value is too big.");
} else {
    System.out.println("There will be "+count+ "people for lunch today.");
}

```

Java Programming
128

Expressions & Flow Control 4

```

if ( x > 5 )
    if ( y > 5 )
        System.out.println( "x and y are > 5" );
    else
        System.out.println( "x is <= 5" );

```

```

if ( x > 5 ){
    if ( y > 5 )
        System.out.println( "x and y are > 5" );
    }
    else
        System.out.println( "x is <= 5" );

```

Java Programming
129

Expressions & Flow Control 4

Branching Statements

The switch statement syntax is:

```

switch (expr1) {
    case expr2:
        statements;
        break;
    case expr3:
        statements;
        break;
    default:
        statements;
        break;
}

```

Java Programming
130

Expressions & Flow Control 4

Common Programming Error

```

int i = 1 ;
switch (i) {
    case 1: System.out.println("bir");
    case 2: System.out.println("iki");
    break;
    case 3: System.out.println("uc");
    case 4: System.out.println("dort");
    default: System.out.println("on");
    break;
}

```

Java Programming
131

Looping Statements

The for statement

```
for (init_expr; boolean testexpr; alter_expr) {  
    statement or block;  
}  
  
int faktoriyel,i;  
for(i=1,faktoriyel=1;i<=9;i++)  
    faktoriyel *= i;  
System.out.println("9!=" + faktoriyel) ;
```

Java Programming

132

Looping Statements

The while loop:

```
while (boolean test) {  
    statement or block;  
}
```

Java Programming

133

```
int faktoriyel = 1, i=1;  
while ( i <= 9 ){  
    faktoriyel *= i;  
    i++;  
}  
System.out.println("9!=" + faktoriyel);
```

Java Programming

134

Looping Statements

The do/while loop:

```
do {  
    statement or block;  
} while (boolean test);
```

```
int faktoriyel = 1, i=1;  
do {  
    faktoriyel *= i;  
    i++ ;  
} while ( i <= 9 );  
System.out.println("9!=" + faktoriyel)
```

Java Programming

135

Special Loop Flow Control

- break [*label*];
- continue [*label*];
- label: *statement*; // where *statement* should
// be a loop.

Java Programming

136

The break statement:

```
do {  
    statement or block;  
    if (condition is true)  
        break;  
    statement or block;  
} while (boolean expression);
```

Java Programming

137

The **continue** statement:

```
do {
    statement or block;
    if (condition is true)
        continue;
    statement or block;
} while (boolean expression);
```

The **break** statement with a label named **outer**:

outer:

```
do {
    statement or block;
    do {
        statement or block;
        if (condition is true)
            break outer;
        statement or block;
    } while (boolean expression);
    statement or block;
} while (boolean expression);
Statement;
```

The **continue** statement with a label named **test**:

test:

```
do {
    statement or block;
    do {
        statement or block;
        if (condition is true)
            continue test;
        statement or block;
    } while (boolean expression);
    statement or block;
} while (boolean expression);
```

3# Identifiers, Keywords, and Types

- Exercise-1: "Using Loops and Branching Statements"
- Exercise-2: "Modifying the withdraw Method"
- Exercise-3: "Using Nested Loops"

An integer number is said to be a perfect number if its factors, including 1 (but not the number itself), sum to the number. For example, 6 is a perfect number because $6=1+2+3$. Write a main function that determines all the perfect numbers between 1 and 5000. Print the factors of each perfect number to confirm that the number is indeed perfect.

```
import java.io.*;

public class PerfectNumber {
    public static void main(String[] args) {
        int i,j,sum;

        for(j=2;j<5001;j++){
            sum = 1;
            for(i=2 ;i<=j/2;i++){
                if( (j % i) == 0 ) sum += i;
            }
            if(sum == j){
                System.out.print("n"+j+" is a perfect number, since "+j+"=");
                for(i=1;i<=j/2;i++){
                    if( (j%i) == 0 )
                        System.out.print(i+" ");
                }
            }
        }
    }
}
```
